

Diecutting Station for perforating and punching materials

The punch/perforation station is based on a rotating punch. The system can be used to apply perforation zones with repeat dimensions, and is driven by an independent servo system. It makes use of hydraulic load cells for pressure regulation, and has a simple die-swapping system with a nylon plate guide that features an adjustable angle.

OPTIONS

An extensive selection of options is available on all our machines.

For more information, contact us so that we can configure the machine to your requirements.
